

Chrome is making it harder to run Flash. In Chrome 62, you either have to enable or disable Flash completely, or allow Flash per website.

To enable/disable Flash in Chrome:

1. Click the menu option in the top right corner of the Chrome window (three dots aligned vertically).
2. In the drop-down, click "Settings."
3. Scroll down to the bottom of the page and click "Advanced Settings."
4. Click "Content Settings."
5. Click "Flash."

Turn "Block sites from running Flash" **OFF** to **ENABLE** Flash.

Turn "Block sites from running Flash" **ON** to **DISABLE** Flash.

To allow Flash for individual websites:

1. In Chrome's Flash settings, enable "Ask first".
2. Go to the Flash website.
3. Click "green lock" icon or "i in circle" icon at the left side of address bar.
4. In the menu, choose "Always allow on this site" for Flash.
5. Reload.

If the content contains Flash plugins smaller than 400px x 300px, they will always be blocked. You will need to click the "plugin blocked" icon in top right corner and click "run all plugins this time".
